Movie Recommender App

This app is used to recommend movies to the user based on an input of what the user likes currently. It processes the input and delivers a recommendation.

Installation

Download the .ipynb file from [Github](https://github.com/etvanceDSC/DSC680/blob/main/DSC680%20Final%20Portfolio/Project6%20-%20%20Movie%20Recommendation%20Model/Movie%20Recommender) and open it using a Jupyter Notebook compatible IDE. Then simply run the program.

Usage

The program will require an input from the user for a movie that they like. Based on the answer, a model will kick off analyzing all the attributes of the movie that the user selected. Based on those attributes, the model will select similar movies and recommend them to the user. After that is complete, the program will ask if the user wants another recommendation or if they want to quit, and the user will have the option of ending or continuing. Pretty simple!

Contributing

Right now, no contributions are being accepted as this is a mature and finished app.
