Weather Checker App

This app is used to check the weather after putting in a zip code in an input.

Installation

Download the .py file from [Github](https://github.com/etvanceDSC/DSC680/blob/main/DSC680%20Final%20Portfolio/Project4%20-%20%20Weather%20Checker%20App/Weather%20App) and open it using a Python-compatible IDE.

Usage

The program will ask the user to input a 5 digit zip code. It will then ask what type of temperature they want to see, Kelvin/Celsius/Fahrenheit. Upon receiving the required inputs, it will return the weather for that area after calling an API for a weather database. The information returned about the weather will be pretty-printed for the benefit of the user to make things more readable.

Finally, when the user is satisfied, they will be asked if they want to search for another zip code or if they are finished with the program.

Contributing

Right now, no contributions are being accepted as this is a mature and finished app.
